
SOT22-LDCC-T1

Features

- ◆ Single Fiber 10G asymmetrical EPON ONU Transceiver
 - 1310nm burst-mode 1.25 Gb/s transmitter with DFB laser
 - 1577nm continuous-mode 10.3125Gb/s APD/TIA receiver
- ◆ Digital diagnostic monitoring (DDM) with internal calibration
- ◆ SFP+ package with SC APC receptacle connector
- ◆ +3.3V separated power supply, Low power dissipation
- ◆ LVPECL interface logic level for data input
- ◆ CML interface logic level for data output
- ◆ LVTTTL for burst signal input
- ◆ LVTTTL for receiver loss of signal detect indication
- ◆ Compliant with IEEE 802.3av
- ◆ SFF-8472 compliant
- ◆ Telcordia GR-468-CORE and MIL-STD-883 compliant
- ◆ RoHS-6/6 compliant
- ◆ Operating temperature range: 0°C ~ +70°C
- ◆ FCC Part 15 Class B / EN55022 Class B (CISPR 22B) / VCCI Class B compliant.

Applications

- ◆ Asymmetric 10G EPON PRX30 ONU

Description

The SOT22-LDCC-T1 10/1G asymmetrical EPON ONU transceiver is designed for single mode fiber and operates at wavelength of 1310nm. The transceiver module uses a DFB laser diode and fully compliant with IEC60825 and CDRH class 1 eye safety. It contains APC functions, a temperature compensation circuit to ensure compliance with IEEE 802.3av requirements at operating temperature.

The receiver section uses a hermetic packaged APD-TIA (APD with trans-impedance amplifier) and a limiting amplifier. The APD converts optical power into electrical current and the current is transformed to voltage by the trans-impedance amplifier. The differential DATA and /DATA CML data signals are produced by the limiting amplifier. The APD-TIA is AC coupled to the limiting amplifier through a low pass filter.

Note 2: P_{SEN} Measured with a PRBS $2^{31}-1$ test pattern @10.3125 Gbit/s, BER = 10^{-3} , EOL.

Note 3: A decrease in optical power below the specified level will cause the Loss of Signal output to switch from a low state to a high state.

Note 4: An increase in optical power above the specified level will cause the Loss of Signal output to switch from a high state to a low state.

Note 5: CML output, AC coupled internally, guaranteed in the full range of input optical power.

Digital Diagnostic Memory Map

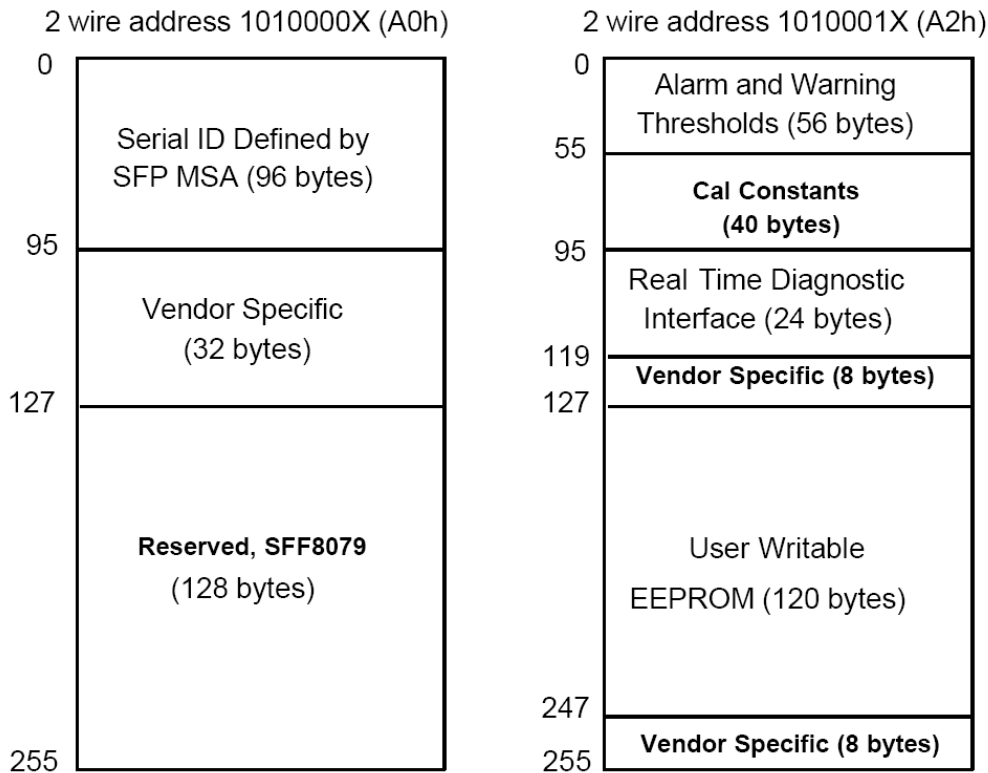

Figure1

EEPROM Serial ID Memory Contents

The module provides digital diagnostic information of its operating conditions and status, including transmitting power, received power, laser bias current, module temperature, and supply voltage. Calibration and alarm/warning threshold data are written and stored in internal memory. The memory map is compatible with SFF-8472.

Note 1: VeeR and VeeT internally connected within the PON module.

Note 2: TX Fault indicates the status of module with pull up resistor of 4.7KΩ~10 KΩexternally. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.4V.

Note 3: TX_burst is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 10KΩresistor.

Note 4: These are the module definition pins.

SDA is serial data signal with 4.7KΩ~10 KΩ pull up resistor externally.

SCL is serial clock signal with 4.7KΩ~10 KΩ pull up resistor externally.

MOD_Det is grounded internally and need 10 KΩ pull up resistor externally to indicate that the module is present.

Note 5: TX_SD function monitors the state of the LD laser, when the MAC enables the module, the TX_SD goes high within a short time.

Note 6: LOS (Loss of Signal) indicates the status of received optical power with 4.7KΩ~10 KΩ pull up resistor externally.

Note 7: TD-/+ : These are the differential transmitter inputs. They are AC-coupled, differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board.

Function Description

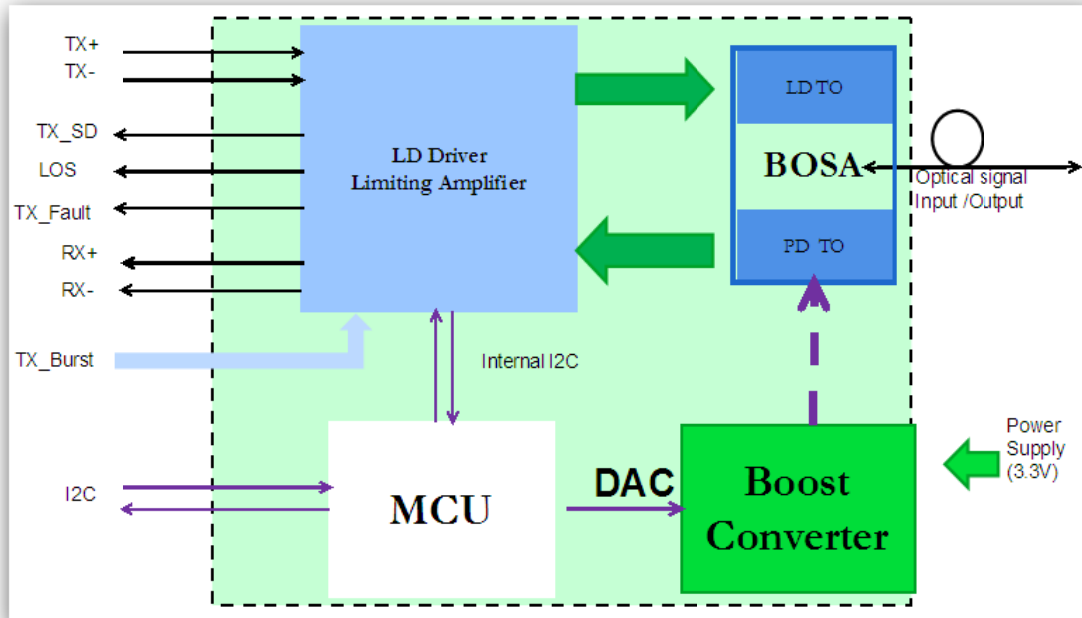

Figure3 Block diagram

The burst-mode transmitter part has a 1310nm DFB laser. It features AC-coupled differential data inputs. Tx_Burst is a LVTTTL input for TX shut down control. Logic "1" disables the LD driver.

The 1577nm continuous-mode receiver part has a high performance detector. The preamplifier (TIA) and limiting amplifier amplify the incoming optical signal into the stable range and convert the signal to differential AC-coupled CML outputs. LOS is LVTTTL output, which logic "1" indicates the input power is lower than the threshold, logic "0" indicates the input power is above the threshold.
