# SLE20-D6C-T1

## Features

- ◆ Single fiber bi-directional data links TX 1.25Gbps/RX1.25Gbps application
- ◆ 1490nm continuous-mode DFB laser transmitter and 1310nm burst-mode APD-TIA receiver
- ◆ Compatible with SFP MSA, Hot-pluggable SFP footprint
- ◆ Small Form Factor Pluggable package with SC/UPC Connector
- ◆ 0 to 70°C operating temperature, -40~+85°C storage temperature
- ◆ Single 3.3V power supply
- ◆ Digital diagnostic monitoring interface
- ◆ Small size, it can be used in the optical access system of high density optical interface
- ◆ Low EMI and excellent ESD protection
- ◆ Class I laser safety standard IEC-60825 compliant
- ◆ RoHS6 Compliance

## Applications

- ◆ Gigabit Ethernet Passive Optical Networks (GEPON)

## Standards

- ◆ Complies with SFP Multi-Source Agreement (MSA) SFF-8074i
- ◆ Complies with IEEE 802.3ah
- ◆ Complies with FCC 47 CFR Part 15, Class B
- ◆ Complies with FDA 21 CFR 1040.10 and 1040.11 except for deviations pursuant to Laser Notice No. 50, dated June 24, 2007
- ◆ Complies with SFF-8472
- ◆ Compatible with TR-NWT-000870 4.1 ESD sensitivity classification Class2.
- ◆ Compatible with Telcordia GR-468-CORE

## General Description

It is based on the IEEE 802.3ah 1000BASE PX-20 specification for bidirectional communications over a single fiber and incorporates a high performance 1310nm burst mode APD Receiver and 1490nm CW mode DFB transmitter.

## EEPROM Serial ID Memory Contents

The optical transceiver contains an EEPROM. It provides access to sophisticated identification information that describes the transceiver’s capabilities, standard interfaces, manufacturer, and other information. When the serial protocol is activated, the host generates the serial clock signal (SCL, Mod Def 1). The positive edge clocks data into those segments of the EEPROM that are not writing protected within the SFP transceiver. The negative edge clocks data from the SFP transceiver. The serial data signal (SDA, Mod Def 2) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially.

The Module provides diagnostic information about the present operating conditions. The transceiver generates this diagnostic data by digitization of internal analog signals. Calibration and alarm/warning threshold data is written during device manufacture. Received power monitoring, transmitted power monitoring, bias current monitoring, supply voltage monitoring and temperature monitoring all are implemented. The diagnostic data are raw A/D values and must be converted to real world units using calibration constants stored in EEPROM locations 56 – 95 at wire serial bus address A2h. The digital diagnostic memory map specific data fields define as following.
